The electrical energy consumed in a circuit is the loss of electrical potential energy in maintaining current in the circuit. Thus in the figure above, as the charge q ($= It$) moves from point A to B, it loses electric potential energy $= qV = V/t$ joules. This loss of electric potential energy is convened into heat.

This voltage drop principle leads to another important law in basic electrical engineering, Kirchoff's Voltage Law (KVL). This law states that the algebraic sum of the voltages in a closed loop is always equal to zero. If we only knew the supply potential and the voltage drop of $R1$, we could use KVL to find the other voltage drop.
