The microservices architecture is a decentralized architecture which constitutes of multiple such microservices. The individual microservices communicate with each other through the HTTP REST or a message bus asynchronously. The flexibility of microservices enables continuous, efficient, and independent deployment of application function units.

Microservices - Architect Blockchain Applications as ...

Microservice architecture becomes more and more popular in the latest years. Microservices are small and autonomous services deployed independently, with a single and clearly defined purpose. Because of their independent deployment, they have a lot of advantages.

Implementing a Microservices System with Blockchain Smart ...

Both blockchain and microservices are the byproducts of a distributed architecture, but they solve very different types of problems. For instance, blockchain is more focused on transactions enabling while microservices are focused more on streamlining speed and scalability.

At Developer Week in Oakland earlier this year, Mike Myburgh, principal consultant, office of the CTO at Tibco, laid out a concept architecture that includes blockchain through Hyperledger to produce a distributed transaction system for use with microservices. Myburgh said that blockchain can be used to build a "distributed system of record. When you have a blockchain, you have a set of nodes around the network where your transaction are stored. It's a peer-to-peer system where ...
