No question in theoretical biology has been more perennially controversial or perplexing than "What is a species?" Recent advances in phylogenetic theory have called into question traditional views of species and spawned many concepts that are currently competing for general acceptance. Once the subject of esoteric intellectual exercises, the "species problem" has emerged as a critically important aspect of global environmental concerns. Completion of an inventory of biodiversity, success in conservation, predictive knowledge about life on earth, management of material resources, formulation of scientifically credible public policy and law, and more depend upon our adoption of the "right" species concept. Quentin D. Wheeler and Rudolf Meier present a debate among top systematic biology theorists to consider the strengths and weaknesses of five competing concepts. Debaters include (1) Ernst Mayr (Biological Species Concept), (2) Rudolf Meier and Rainer Willmann (Hennigian species concept), (3) Brent Mishler and Edward Theriot (one version of the Phylogenetic Species Concept), (4) Quentin Wheeler and Norman Platnick (a competing version of the Phylogenetic Species Concept), and (5) E. O. Wiley and Richard Mayden (the Evolutionary Species Concept). Each author or pair of authors contributes three essays to the debate: first, a position paper with an opening argument for their respective concept of species; second, a counterpoint view of the weakness of competing concepts; and, finally, a rebuttal of the attacks made by other authors. This unique and lively debate format makes the comparative advantages and disadvantages of competing species concepts clear and accessible in a single book for the first time, bringing to light numerous controversies in phylogenetic theory, taxonomy, and philosophy of science that are important to a wide audience. Species Concepts and Phylogenetic Theory will meet a need among scientists, conservationists, policy-makers, and students of biology for an explicit, critical evaluation of a large and complex literature on species. An important reference for professionals, the book will prove especially useful in classrooms and discussion groups where students may find a concise, lucid entrée to one of the most complex questions facing science and society.

Ranging from huge cacti and broadleaf trees to tiny arctic flowers, flowering plants are the most vital component of global biodiversity. They provide the crops that feed us, medicines, oils, fibres, herbs, spices, dyes, beverages, timber and habitats for countless animals. This updated and revised successor to a classic book, *Flowering Plants of the World* is an authoritative, fascinating introduction to the Earth's most colourful flora comprising comprehensive accounts of more than 500 flowering plant families. Each entry describes distribution, diagnostic features, classification, structures, uses and ecology of flowering plants. Over 1,000 visually stunning and precisely scaled illustrations display the major characteristics of key plants and detailed maps show worldwide distribution. Written by a team of acknowledged experts, this is the definitive survey of flowering plants worldwide and brings to the forefront the latest views on their classification. An extensive and meticulously illustrated glossary describes the specialist terms used in the text, and a comprehensive index includes plant names in both Latin and English. Both as a book of breathtaking beauty and a discourse on the science of flowering plants, this essential reference is sure to become a horticultural and botanical classic and part of every gardening enthusiast's and plant scientist's library.

There is increasing need for good estimates of impending rates of extinction of plant and animal species, based on an understanding of extinction rates in the recent and far past, and on the underlying ecological and evolutionary causes. This book provides a more wide-ranging and data-driven treatment of current and likely future extinction rates than has previously been drawn together in one place. It is directed broadly at senior undergraduates, postgraduate students, and research workers in the general fields of ecology, conservation biology, and the environmental sciences. The authors highlight apparent differences in extinction rates among taxonomic groups and places, aiming to identify unresolved issues and important questions.
