Mad Cow Disease And Related

Currently, the most accepted theory is that the agent is a modified form of a normal protein known as prion protein. For reasons that are not yet understood, the normal prion protein changes into a pathogenic (harmful) form that then damages the central nervous system of cattle. Mad Cow Disease is a neurological disorder of cattle.

Mad Cow Disease in Humans Symptoms, Causes, Treatment

Mad cow disease is caused by an infectious transmissible agent termed a prion. Mad cow disease was first noted in the 1970s and is thought to be related to another prion-caused disease termed scrapie that occurs in sheep; the first major outbreak of mad cow disease was in the United Kingdom, where more than 184,500 cases have been noted in cattle (2010 U.K. data found only 11 infected cattle).
