How to configure MariaDB for remote client access. Some MariaDB packages bind MariaDB to 127.0.0.1 (the loopback IP address) by default as a security measure using the bind-address configuration directive. Old MySQL packages sometimes disabled TCP/IP networking altogether using the skip-networking directive. Before going in to how to configure these, let's explain what each of them actually does:

MariaDB is up and running as we expected. As it is, MariaDB is not secured and any user can log in to the database engine and have access to all the databases and make changes. Of course, we don't want that to happen and securing the database should be a top priority. We, therefore, need to secure the database engine by setting a root password.
